Banded Waterfowl Recovered in Iowa (1948-1951)

By JAMES G. SIEH

Waterfowl banded throughout continental North America have been recovered in Iowa. The U. S. Fish and Wildlife Service, via the Bird-Banding Office, Pautuxent, Maryland, has supplied the State Conservation Commission with 340 waterfowl recoveries reported from Iowa since 1948. These recoveries represented 256 mallards (Figure 1), 26 pintails, 15 blue-winged teal, and 11 black ducks. Ten other species of ducks were represented by only 25 recoveries. Six Canada geese and one coot complete the list of waterfowl recoveries in this report.

Fifty percent of all the mallards recovered in Iowa carried their bands less than one year. Approximately 25% of the mallards recovered carried their bands 1-2 years, and 11% carried them 2-3 years. The remaining 14% were represented by mallards carrying bands 3-4, 4-5, 5-6, 6-7, 7-8, 8-9, 9-10, 10-11, and 16-17 years respectively (Table 1). Approximately 75% of the 84 recoveries of waterfowl, other than mallards, carried bands less than one year. Practically all recoveries were taken from waterfowl killed during the open season.

Forty-three of the 84 recoveries of banded waterfowl, other than mallards, were located in counties bordering the Mississippi and Missouri Rivers. Ten of the 11 black duck recoveries were taken in counties bordering the Mississippi River. The eleventh black duck was recovered in Johnson county just one county west of the Mississippi. Of the remaining thirty recoveries, fifteen were located in the lakes region of northwestern Iowa, and the remainder were widespread throughout the state (Figure 2).

Forty-seven percent of the banded mallards were recovered in counties bordering the Mississippi River; however, this did not indicate that approximately half of the mallards killed in Iowa were taken along the river counties because 45% of all the banded mallards recovered in Iowa were banded in Illinois, and 63% of all mallards recovered in the ten Mississippi River counties were banded in Illinois. The proximity of the points of banding in Illinois increased proportionately the large number of mallard returns along the Mississippi River in Iowa.

Since 1948 there have been 113 mallards recovered in Iowa that were banded in Illinois. Forty-two were banded at Spring Lake,

Savanna, Illinois just across the Mississippi River from Sabula, Iowa. Nineteen of these mallards which were banded at Spring Lake in the fall of 1948 were recovered the same fall along the Mississippi River in Jackson, Clinton, and Scott counties. Just one of these nineteen birds was recovered in an inland county, and that just across the Jackson county line in Jones county. This indicated a tendency of these mallards to remain along the Mississippi River during the fall of 1948 in the Sabula area, and little tendency to move inland.

Figure 1. Location of each banded mallard duck recovered in Iowa since 1948. Each dot (•) represents one recovery.

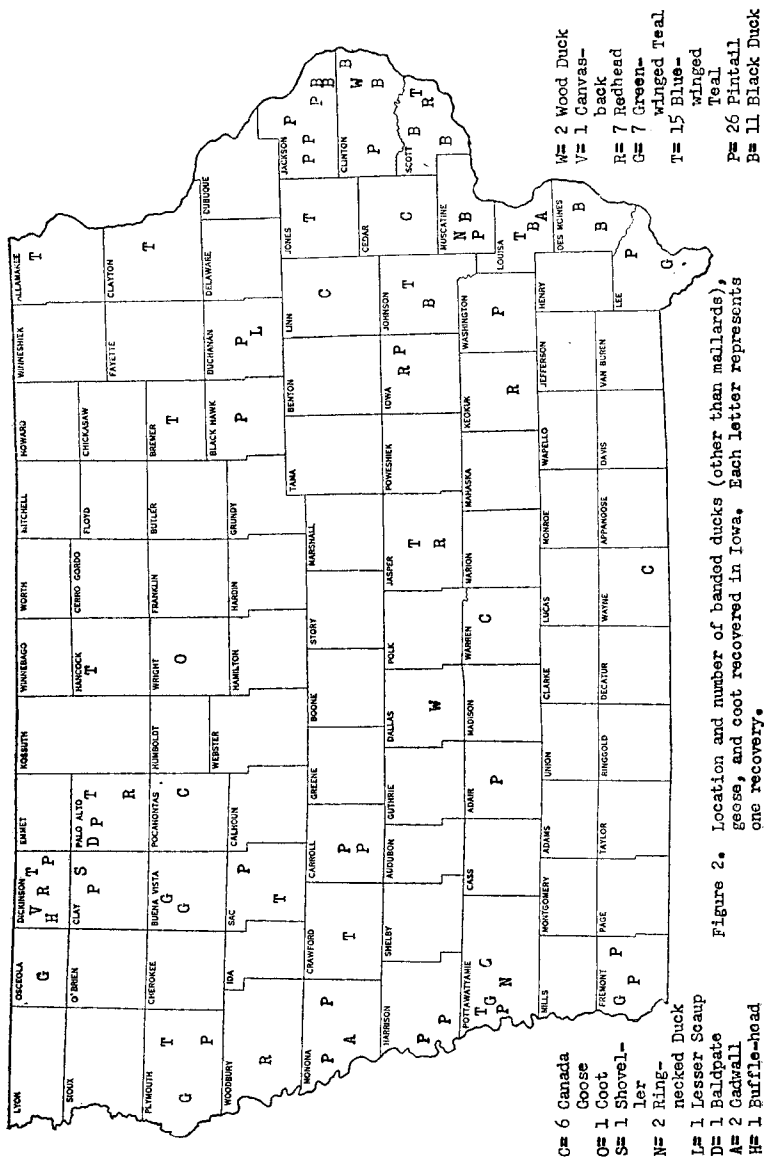

Table 1

Species and Number of Banded Waterfowl Recovered in Iowa and
The Number of Years Each Band Was Carried

Years	0-1	1-2	2-3	3-4	4-5	5-6	6-7	7-8	8-9	9-10	10-11	16-17
Canada Goose (<i>Branta canadensis</i> <i>canadensis</i>)	4	1										
Lesser Canada Goose (<i>Branta canadensis</i> <i>leucopareia</i>)	1											
Coot (<i>Fulica americana</i>)		1										
Shoveller (<i>Spatula clypeata</i>)	1											
Ring-necked Duck (<i>Nyroca collaris</i>)	1										1	
Lesser Scaup (<i>Nyroca affinis</i>)	1											
Baldpate (<i>Mareca americana</i>)	1											
Gadwall (<i>Chaulelasmus streperus</i>)	2											
Buffle-head (<i>Charitonetta albeola</i>)	1											
Wood Duck (<i>Aix sponsa</i>)	1				1							
Canvas-back (<i>Nyroca valisneria</i>)	1											
Redhead (<i>Nyroca americana</i>)	5	1	1									
Green-winged Teal (<i>Nettion carolinense</i>)	7											
Blue-winged Teal (<i>Querquedula discors</i>)	14			1								
Pintail (<i>Dafila acuta</i>)	17	6	3									
Black Duck (<i>Anas rubripes</i>)	5	2	1	1				1		1		
Mallard (<i>Anas platyrhynchos</i>)	127	62	28	11	10	3	5	5	1	1	2	1*

*The number of years this band was carried is questionable. The years were assumed from the date of letter of recovery. The exact date the bird (band) was recovered was not available.

Twenty-two of the remaining 23 mallards banded at Spring Lake and recovered one to five years later also returned along the Mississippi River during subsequent fall migrations. (Figure 3). Of these 23 birds only four were recovered in counties not adjacent to the Mississippi. Three of these four recoveries occurred in Cedar, Johnson, and Iowa counties which are second and third counties west of the river. The fourth recovery occurred in Winnebago coun-

Figure 3. Location of mallards recovered in Iowa which were banded at Spring Lake, Savanna, Illinois. Numbers indicate aggregate spring and fall migrations between date of banding and recovery. Each number represents one recovery.

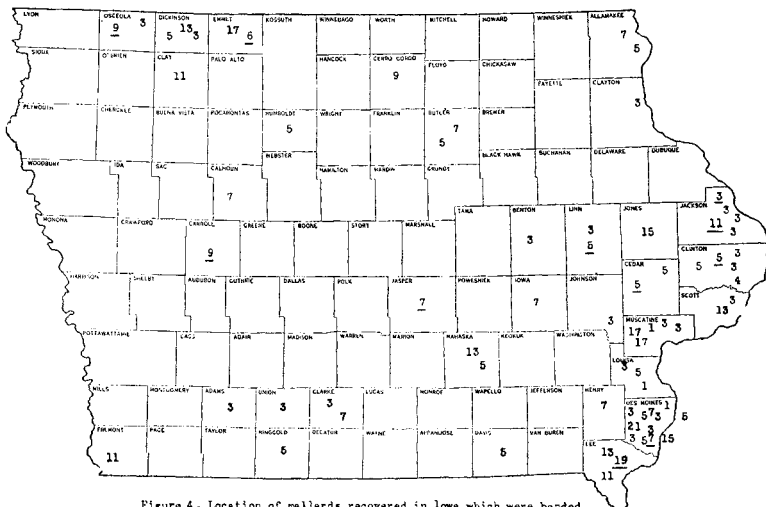

Figure 4. Location of mallards recovered in Iowa which were banded at Chautauqua Refuge, Havana, Illinois. Numbers indicate aggregate spring and fall migrations between date of banding and recovery (numbers underlined indicate mallards banded at Flat Lake, Grafton, Ill., or McGinnis Slough, Orland Park, Ill.).

ty, an inland county. These recoveries indicated that these mallards banded at Spring Lake returned along the Mississippi River during subsequent fall migrations, and remained close to the river or its tributaries during the fall.

Sixty mallards banded at the Chautauqua Refuge, Havana, Illinois near the Illinois River were recovered in Iowa (Figure 4). Unlike the recoveries from Spring Lake, the recoveries from Chautauqua Refuge were widespread throughout Iowa, and there were no recoveries of banded mallards taken in Iowa the same fall that they were banded at Chautauqua. This may indicate that there is little if any movement of mallards from the Chautauqua Refuge into Iowa during the same fall migratory period; however, during subsequent fall migrations that there is considerable movement of these same birds into Iowa. It is interesting to note that while the majority of mallards banded at Chautauqua Refuge were recovered along the Mississippi River and its nearby tributaries, six mallards were recovered in northwestern Iowa, and 12 were scattered throughout central and southern Iowa.

Thirteen states and six provinces contributed 84 banded waterfowl, other than mallards, including six Canada geese and one coot which were recovered in Iowa. New Brunswick, Quebec, and British Columbia each provided one bird; Manitoba contributed 24, Saskatchewan nine, and Alberta and California each three. Illinois topped the list of states with ten waterfowl (other than mallards) recovered in Iowa. Missouri supplied six banded waterfowl, five of which were geese. Michigan also provided six waterfowl, and North and South Dakota each five, Louisiana, Nebraska, and Wisconsin each provided two banded ducks while Colorado, Indiana, New York, and Tennessee each contributed one waterfowl recovered in Iowa.

Seventeen states contributed 204 banded mallards which were recovered in Iowa. Illinois supplied the largest number, 113. North Dakota provided 17 banded mallards, Wisconsin 16, Oklahoma and Minnesota each 12. Arkansas and Colorado each supplied six, South Dakota five, Alabama and Missouri each three; Indiana, Louisiana, Nebraska, and Ohio each two, and Michigan, Oregon, and Pennsylvania each one. Four provinces contributed 52 banded mallards recovered in Iowa. Manitoba supplied 34, Alberta nine, Saskatchewan six, and Ontario three.

The grand total of 256 banded mallards were recovered in 63 Iowa counties. The 113 banded in Illinois were recovered in 34 Iowa counties, while the 34 mallards banded in Manitoba were recovered

in 25 counties. The 17 mallards banded in North Dakota were recovered in 15 different counties, while the 16 banded in Wisconsin were recovered in 12 counties. The place of banding of mallards recovered in each Iowa county is listed in the appendix, Table 1.

The place and date of banding and recovery, the age and sex of each bird banded are essential data for record purposes. The above data are listed in chronological order of date of banding for each waterfowl recovered in Iowa since 1948 (Appendix, Table 2).

ACKNOWLEDGEMENTS

The writer is indebted to Mr. Everett B. Speaker, Superintendent of Biology, of the State Conservation Commission, for his counsel and encouragement; and likewise to his co-workers at the Biology Building, Okoboji, Iowa, for their cooperation and assistance. Appreciation and thanks are expressed to Seth H. Low and his associates of the Bird-Banding Office, Pautuxent, Maryland, for their major contribution to this project.
